

CEDRO AT THE LEBANESE ARMED FORCE'S STRATEGIC RESEARCH AND STUDIES CENTER

The EU-funded UNDP CEDRO project presented its work at the Lebanese Armed Forces's Strategic Research and Studies Center workshop on March 22nd 2016. Several key stakeholders from the public and private sectors, civic society and non-governmental institutions were present, giving an outlook on the foreseeable future of the Lebanese energy system. One of the key official 'recommendation' that will officially be publicized by the Lebanese Army's media portals that emanated from this workshop is the request to fully support the ongoing CEDRO led study "The Lebanese Army Energy Sustainability Strategy".

WORK STARTED AT LIBANLAIT

Following the competitive bidding process, Phoenix was awarded the implementation of a 214 KWp PV-diesel hybrid system at Libanlait in the Bekaa. Installation of the system on the farm side of the facility started early this year and is expected to be completed by end of April. The project co-benefit will be providing vital extra insulation for the farm shed while producing green energy.

ENERGY 300 COMPETITION

The EU-funded UNDP CEDRO project is launching the "Energy 300" Competition to produce an awareness video on renewable energy open to all Lebanese Universities to create/write a short story or mood board for a video. It is hoped the video will raise awareness on renewable energy while highlighting its importance in tackling the Lebanese energy sector and reducing greenhouse gas emissions. The message should target renewable energy – and in particular simple practices that can easily and effortlessly be adopted. Easy, memorable, and few messages that spring to mind quickly, inspired by small gentle elements that could serve as visual cues or descriptions should be featured. The winner's story/mood board will be produced by CEDRO and shown on various media channels (TV and internet).
