

USEK PV-DIESEL PLANT IS CONNECTED!

The last CEDRO IV PV-diesel hybrid implementation has been connected to the grid and is currently providing the University Campus in Kaslik with clean solar energy. The 212 KWp system is expected to provide 300 MWh / year, hence reducing the dependency on diesel operated generators during blackouts and feeding back into the grid with a chance of net-metering when EDL is available. This plant is a first of a series of initiatives to be implemented in the university as part of their “road to sustainability”.

NEW IMPLEMENTATIONS!

The UNDP under the “Lebanon – Support to Economic Recovery, Community Security and Social Cohesion in Lebanese Communities Affected by the Syrian Crisis” project, funded by the Kingdom of the Netherlands, and in coordination with the Ministry of Energy and Water and the Lebanese Center for Energy Conservation, has launched a call for beneficiaries through which several renewable energy applications are currently under evaluation for the final selection. The 2-year project will co-finance projects that feature social impact in targeted areas classified in the LCRP as most vulnerable.

ENERGY DELIVERY MODELS FOR HUMANITARIAN ASSISTANCE

This month’s featured exchange focuses on energy delivery models for host communities and displaced populations. Ms Obeid, explores the implemented solution by the UNDP Lebanon as part of the support for host communities projects and goes further as to suggest customized models in this field based on end user preference and urgent needs. Finally, Ms. Obeid provides an overview of the required advancements based on the lessons learnt.
